33
34 CASE NO. 40835

1 PROCEEDINGS:

* * *

(Witness sworn/affirmed.)

CHRISTOPHER DAFT, Ph.D.,

5 called as a witness herein, having been first
6 duly sworn/affirmed, was examined and testified
7 as follows:

EXAMINATION

BY MR. WOLFE:

Q. Good morning, Dr. Daft.

A. Good morning.

12 Q. Could you state your name for the
13 record, please?

14 A. Yes. My full name is Christopher Mark
15 William Daft.

16 Q. Have you ever had your deposition taken
17 before?

A. Yes, I have.

Q. How many times?

A. I believe it's six times.

21 Q. You understand that you are under oath
22 today and your testimony needs to be truthful
23 just as it would if you were in front of a judge
24 or jury?

1 database?

2 A. Yes.

3 Q. What are they?

4 A. A template is simply a set of features
5 extracted from the fingerprint, and that can be
6 considerably smaller than the fingerprint image,
7 so it makes engineering sense to store the
8 smaller representation.

9 Q. Do you know how many bytes a template
10 is typically made up of?

11 A. Well, it depends on how rich you want
12 the representation of the fingerprint to be.

13 Q. The template on the Qualcomm phone, do
14 you know how many bytes it takes up?

15 A. I think it's a kilobyte, something in
16 that range.

17 Q. One kilobyte?

18 A. Yes.

19 Q. In the scheme of templates, is that a
20 big one or a small one?

21 A. I think it's normal. The point is that
22 it captures enough -- I mean, it -- you can
23 think of it as a digit compression, you know,
24 like you do a zip file, you do a zip operation

1 Q. Does the Qualcomm product, does it hold
2 an entire image or does it process it through
3 segments?

4 A. It acquires the fingerprint image and
5 then it does -- let me start again. It acquires
6 the ultrasound data.

7 It processes that into a fingerprint
8 image, and then the cleanup process we've been
9 discussing is applied and then the template is
10 made. So it's an image up to the feature
11 extraction.

12 Q. Is it fair to say that -- never mind.
13 I already asked that question. I'm not going to
14 waste your time.

15 Just to make sure that we understand
16 each other, what does the term feature
17 extraction mean to you?

18 A. It means taking the fingerprint image
19 and extracting data that has the essence of the
20 image in it but is smaller.

21 Q. And what does the term template
22 generation mean to you?

23 A. That is making the small binary file
24 which gets stored in the database and uses it

1 for matching.

2 Q. Is it your opinion that there is no
3 difference between a template and a fingerprint
4 image like the one that you captured in the
5 Qualcomm device?

6 A. That's not my opinion, no.

7 Q. What is the difference?

8 A. The difference -- well, there are
9 several differences. The template must capture
10 the essence of the fingerprint in order for the
11 device to function, but the template is
12 considerably smaller than the fingerprint image.

13 Q. And when you say considerably smaller,
14 what do you mean?

15 A. I mean that the fingerprint image might
16 be hundreds of kilobytes when it comes out of
17 the image processing block in the finger we're
18 looking at, whereas the template is perhaps 100
19 times smaller.

20 Q. And what happens that makes the
21 template 100 times smaller than the fingerprint
22 image?

23 A. What happens that makes it a lot
24 smaller is that the feature extraction is

1 Q. In the course of this project, have you
2 reviewed any materials that are not cited at the
3 list at the end of your reports?

4 A. Everything that I -- everything that
5 I've looked at in this case is cited at the end
6 of the report. I'm sorry. Let me bracket that
7 slightly. I mean, obviously I have a bunch of
8 biometric textbooks. You know, I'm sure I've
9 looked at them at some point, just standard
10 literature.

11 Q. Okay. I'm going to mark as [REDACTED]
12 [REDACTED] I'll send it to you just
13 so I have a clear record of what I'm doing.

14 A. Okay. I have that up.

15 (Exhibit 5 was marked for
16 identification.)

17 BY MR. WOLFE:

18 Q. Can you go to paragraph 14 of your
19 rebuttal report.

20 A. Yes, I see it.

21 Q.

22

23

24

1 [REDACTED]
2 [REDACTED]
3 [REDACTED]

4 Did I read that correctly?

5 A. I'm sorry. I didn't hear your
6 question.

7 Q. Did I read that correctly, sir?

8 A. Yes.

9 Q. Do you agree with that definition of
10 fingerprints?

11 A. Yes.

12 Q. Okay. [REDACTED]

13 [REDACTED] [REDACTED]
14 [REDACTED]

15 A. [REDACTED]
16 [REDACTED]
17 [REDACTED] [REDACTED]
18 [REDACTED] [REDACTED]
19 [REDACTED]

20 Q. Did retaining counsel write paragraphs
21 10, 11 and 12?

22 A. They provided that information to me,
23 and so I wanted to make it clear which bits they
24 wrote by beginning the paragraph with [REDACTED]

1 voltage for example. But I should qualify this
2 because in recent years in engineering there has
3 been an enormous amount of work on systems that
4 produce all of the data that we want, so a
5 complete fingerprint image without distortion,
6 while they do not conform to the Nyquist
7 requirement. So I don't -- so classically,
8 historically, Nyquist requirement is a huge
9 deal. In recent years people have been finding
10 ways around this.

11 Q. What are the ways around it?

12 A. So there is a technique in engineering
13 called compressed sensing. What compressed
14 sensing means is acquiring data that doesn't
15 conform to Nyquist and nevertheless getting all
16 of the information out of -- let me put it in
17 our context -- getting all of the fingerprint
18 information that there is.

19 So compressed sensing is an engineering
20 technique that is currently on file because it
21 turns out that conforming to the Nyquist
22 requirement has a large bearing on the cost of
23 devices.

24 So basically what I'm saying is

1 classically Nyquist tells you how you sample in
2 space and in time, but it's not fair to say that
3 that is a completely rigorous requirement that
4 if you don't meet it, your device stops working.
5 That is not -- that is not true.

6 Q. What is the status of these new methods
7 that people are developing to get around the
8 Nyquist theorem?

9 A. They are involved -- they are using a
10 variety of products already. For example,
11 digital photography is using compressed sensing.
12 So you get a photograph out of your digital
13 camera that was not sent -- that was not sent at
14 the Nyquist rate. The resolution of that
15 photograph beats Nyquist.

16 Another example is diagnostic imaging.
17 People are producing CT scans and particularly
18 MRI scans when the dataset that's collected
19 doesn't meet the Nyquist requirements, and still
20 this is providing an image that a physician can
21 use that doesn't have artifacts in it.

22 Q. What is the quality of the image that
23 these methods provide?

24 A. They approach the data quality that you

1 would get if you conformed to the Nyquist
2 requirements.

3 Q. Do they provide the same data quality
4 that you would get if you conformed to the
5 Nyquist requirements?

6 A. That depends. You see, the acquired
7 data always has some problems. For example,
8 every sensor has noise in it. So it's not a
9 perfect fingerprint no matter what you're -- no
10 matter how good your electronics is. So every
11 acquired image has imperfections.

12 What this compressed sensing part of
13 engineering is finding is that they can get the
14 artifacts produced by the compressed sensing by
15 not obeying Nyquist below the other
16 imperfections in the dataset. So at that point
17 it's as good as a data acquisition that conforms
18 to Nyquist.

19 MR. WOLFE: This would be a good time
20 to take a lunch break. So do you want to
21 take 45 minutes?

22 MR. FICZKE: 45, half an hour, whatever
23 works for all you guys.

24 MR. WOLFE: Let's do 45.

1 compression for photographs.

2 I wouldn't call the operation of
3 forming the template, it's not similar to JPEG
4 compression. It's more a feature extraction.
5 But the output is a representation of the key
6 information that's in the image. So I guess the
7 only thing I would say -- what I'd say no to in
8 response to your question is it's not like doing
9 JPEG compression.

10 Q. Do you understand that an algorithm is
11 applied to the image as part of feature
12 extraction and results in a template?

13 A. Yes. The template is a calculation
14 based on the fingerprint image.

15 Q. Does the template contain all of the
16 information originally in the fingerprint image?

17 A. It does not. It contains the essence
18 of it.

19 Q. Does it contain actual images of those
20 essences of a finger image or does it contain
21 them, you know, by typology, you know, ridge
22 ending of this sort in this location?

23 A. It's -- the template is the result of
24 feature extraction and so the template is a list

1 of features derived from the image.

2 Q. Can you explain to me the difference
3 between identification and verification in the
4 biometric context?

5 A. Yes.

6 Q. Please do.

7 A. The classic identification process is
8 what the FBI does. The FBI has had for a long
9 time the A-F-I-S system, and its purpose is to
10 take fingerprint data and produce a name of a
11 person. So that, as the name of the system
12 implies, that's identification.

13 Verification is different.

14 Verification is -- well, let me just give you an
15 example. A person shows up to work. They slide
16 their identity card into the time clock and they
17 put their finger on the sensor. That's
18 verification. So there the time clock is
19 saying, Does this fingerprint match the
20 individual who is defined by what's on the card?
21 So that's different from the identification
22 process.

23 Q. Do you know if the time clocks used by
24 Speedway used verification or identification?

1 A. I don't recall that point.

2 Q. Do you know what the false acceptance
3 rate is for the TimeLink and Kronos time clocks?

4 A. Off the top of my head, no.

5 Q. Is it -- do you agree that it's
6 possible that time clocks used by Speedway
7 potentially could confirm a user or
8 authenticate -- sorry. Bad question.

9 Do you know if the time clocks used by
10 Speedway could potentially identify or verify a
11 user incorrectly? Like if Mr. Ficcko and I had
12 a similar finger -- set of finger ridges and I
13 put my finger on it, is it possible that the
14 clock could think I was Mr. Ficcko clocking in?

15 A. That is possible.

16 Q. How did these -- now I'm asking about
17 the Speedway time clocks. How do those time
18 clocks match a user to a fingerscan?

19 A. There is a comparison between the
20 template which has just been taken, so the live
21 template. That is compared in the
22 identification case with all of the registered
23 fingerprints, and in the authentication case
24 it's compared with just the employee here who

1 has swiped their ID card.

2 Q. And do you know ultimately, so after
3 finger template to finger template is matched,
4 how is that then linked back to an individual,
5 if at all?

6 A. In the authentication case, the
7 individual has been signalled by the card, and
8 these devices are networked, and so the clock
9 may have a database of employees or the clock
10 may ask essential server for information as to
11 which person this is, so either of those is
12 possible.

13 Q. Okay. [REDACTED]

14 [REDACTED]

15 [REDACTED] [REDACTED]

16 A. Yes. I have that up.

17 Q. Okay. It says:

18 [REDACTED]

19 [REDACTED]

20 [REDACTED]

21 [REDACTED]

22 A. I see that.

23 Q. I have a very basic question first.

24 There is no citation here. How do you know that

1 Speedway used those time clocks?

2 A. That was provided to me by retaining
3 counsel.

4 Q. Do you know what kinds of sensors these
5 clocks use, by which I mean acoustic,
6 capacitive, optical, some other kind?

7 A. So there are three; the TimeLink, the
8 Kronos -- the two Kronos are using the Sagem
9 reader, and I guess the Syntel is using a
10 different one, and these are optical devices.

11 Q. Other than this case, do you have any
12 experience with optical sensors in time clocks?

13 A. I have lots of experience with optical
14 sensors in my biomedical engineering work. This
15 is the first case I've been involved with about
16 time clocks.

17 Q. In the last ten years how much of your
18 time have you spent working with optical
19 sensors? Just by percentage.

20 A. This year probably 40 percent. Earlier
21 than that, less.

22 Q. How much less? Less than ten percent?

23 A. Maybe ten percent is a reasonable
24 number for previous years, but I don't have that

1 area -- I mentioned that I'm doing work with the
2 University of Arizona and I hope there will be a
3 publication about that, but as of today there is
4 not.

5 Q. [REDACTED]

6 [REDACTED]
7 [REDACTED]
8 [REDACTED]
9 [REDACTED]
10 [REDACTED]

11 So is it your opinion that a
12 fingerprint was captured by the fingerprint
13 reader used in the TimeLink 3100 and the Kronos
14 9000 and 9100?

15 A. Yes.

16 Q. And that opinion was based on the
17 methodology you described in paragraph 13 where
18 you said what you did?

19 A. Yes.

20 Q. Okay. Go to paragraph 17, please.

21 A. I have that up.

22 Q. Here you write:

1 Do you see that?

2 A. Yes.

3 Q. Is this the document that you based
4 paragraph 17 on?

5 A. That is where I got this direct
6 citation from. But when I -- I understood from
7 Mr. Marek's report that he was using a
8 definition of fingerprint that I had never heard
9 before. I also went to look at some standard
10 textbooks to understand whether fingerprint was
11 somehow not what I thought it was, and what I
12 found was that all of the reference material
13 that I consulted used fingerprint to mean just
14 the pattern of ridges and valleys.

15 So I do not understand -- or rather I
16 disagree with Mr. Marek's contention that
17 somehow this is not a fingerprint reader.

18 Q. Okay. But that's not my question
19 though. My question is about your opening
20 report, okay? Is this the document that you
21 relied upon for the opinion given in paragraph
22 17?

23 A. Yes.

24 Q. And do you know where this document

1 Q. People who will do things like approve
2 time cards for payroll, right?

3 A. Yes.

4 Q. Is this document the entire basis for
5 your opinion in the opening report that the
6 TimeLink clocks collect a fingerprint?

7 A. No.

8 Q. So what else do you base that opinion
9 on? Remember, this is just about your opening
10 report.

11 A. Yeah. So my opinion that this is
12 recording a fingerprint and it's using the
13 fingerprint reader comes from not only that
14 particular document but also my understanding
15 having worked in the field of what the word
16 fingerprint means.

17 To me it's plainly obvious that this is
18 a time clock with a fingerprint reader on it.
19 And why is it so obvious? Well, because I have
20 worked on fingerprint readers and I am familiar
21 with the literature, and the device that's
22 pictured in that document is a fingerprint
23 reader, and I am baffled by how there is
24 controversy about that.

1 Q. So your opinion is based on the user
2 manual and your experience in the field,
3 correct?

4 A. Yes.

5 Q. That's all?

6 A. Well, as I say, I've been doing
7 biomedical engineering for 30 years. I've
8 worked on a large fingerprint project during
9 which everyone in the team referred to it as a
10 fingerprint reader, and that fingerprint reader
11 appears to have the same function as the clock
12 we're talking about here.

13 Q. Okay. Go to paragraph 19 of your
14 opening report, please.

15 A. Okay. I see that.

16 Q. Does paragraph 19 state the entire
17 basis for your opinion in the opening report
18 that the Kronos 9000 and 9100 time clocks
19 capture a fingerprint?

20 A. I think this is the same as what we
21 just discussed. There is certainly user manual
22 evidence that talks about fingerscan images, and
23 my experience in the field backs up the --
24 what's in the user manual which is that this is

1 plainly a fingerprint reader.

2 Q. Okay. I'm going to show you and mark
3 as [REDACTED] which is the entire
4 document. It's the full version of the document
5 you cite in paragraph 19 for pages 51 and 93.

6 (Exhibit 8 was marked for
7 identification.)

8 BY THE WITNESS:

9 A. Okay. I have that up.

10 BY MR. WOLFE:

11 Q. Can you go to page 51 of this document,
12 please?

13 A. Okay. I am at page 51.

14 Q. [REDACTED]

15 [REDACTED]

16 A. What I've got is page 51. [REDACTED]

17 [REDACTED]

18 Q. I'm sorry. I mean [REDACTED]

19 A. Okay. Right. Let me go there.

20 Q. That was my fault.

21 A. I'm sorry. What was your question? I
22 have got the Bates number now.

23 Q. [REDACTED]

24 [REDACTED]

1 been instructed about how the BIPA uses these
2 words is fingerscan, that's the process that you
3 get a fingerprint from.

4 Q. Can we go to [REDACTED] in that
5 document.

6 A. Okay. I've got that page.

7 Q. [REDACTED]

8 [REDACTED]

9 [REDACTED]

10 [REDACTED]

11 [REDACTED]

12 [REDACTED]

13 A. Yes. So you see in the beginning of
14 that [REDACTED] So that's the
15 process, and so as a result of that process
16 you've got fingerprints, and that's what is
17 converted into a template and the template is
18 then matched against stored information.

19 Q. The template is matched against the
20 stored template?

21 A. That's right.

22 Q. [REDACTED] if I didn't
23 say that already.

24 Do you understand that Speedway also

1 Q. Do you have any reason to disagree with
2 that?

3 A. No.

4 Q. So is it your opinion that the devices
5 Speedway used stored an image like the one in
6 Figure 1 of the ink fingerprint?

7 A. I'm sorry. Could you repeat that
8 question?

9 Q. Is it your opinion that the
10 devices/time clocks used by Speedway store an
11 image like the ink fingerprint shown in Figure 1
12 to Mr. Minta's opening report?

13 A. Yes. They have to because they need to
14 compute the template.

15 Q. How long is that image stored?

16 A. I don't know.

17 Q. Is it stored permanently in solid state
18 memory?

19 A. I don't have that information.

20 Q. You don't know one way or the other?

21 A. I don't know.

22 Q. Based on your experience in biometrics,
23 that would be unusual, right?

24 A. It would be, but, you know, I don't

1 A. Yes.

2 Q. We established already that the
3 TimeLink and Kronos devices both use the Morpho
4 scanner, right?

5 A. That's my understanding.

6 Q. What is that understanding based on?

7 A. Retaining counsel told me.

8 Q. The Morpho scanner requires the user to
9 put their finger in a fixed precise place,
10 correct?

11 A. I would need to look at the document
12 about that. I don't have that information off
13 the top of my head.

14 Q. Okay. Let's go back to I think it's
15 Exhibit 6 which is SSPA00001. And go to -- I
16 may have my exhibit numbers wrong, but I'm
17 talking about the TimeLink User Manual.

18 A. Yes, I have that.

19 Q. Go to page SSPA0004 again, the same one
20 you relied on in your report, okay?

21 A. I have that.

22 Q. Do you see the Tip there in the center
23 left of the page?

24 A. I do.

1 and that would be the only place that I would
2 not know. But my arm, for example, that would
3 not work because it just doesn't have the ridges
4 and valleys.

5 Q. What about a knuckle?

6 A. That seems -- that would be very
7 different data than what the device is looking
8 for, so I wouldn't be optimistic that that would
9 work.

10 Q. Have you ever heard of such a thing?

11 A. No. When people are trying to defeat
12 these types of devices, it's more the, you know,
13 spoof finger, you know, made with a mold.

14 Q. My question was, have you ever heard of
15 someone who could enroll on a time clock by
16 using their knuckle or a different part of their
17 hand or the back of their finger?

18 A. I have not heard of that.

19 Q. Have you ever used a fingerscan time
20 clock in the course of your employment?

21 A. I have not.

22 Q. So staying on the topic of the
23 Morpho-enabled devices, whatever image is
24 captured can be no larger than the scan surface.

1 Do you agree with that?

2 A. I wouldn't put it that way.

3 Q. How would you put it?

4 A. The size of the image is going to be
5 determined both by the dimensions of the scan
6 surface and also by the resolution of the
7 reader, so it's not just the scan surface.

8 Q. Let me simplify it. Can you look at
9 Exhibit 10 again?

10 A. Can you tell me which one that is?

11 Q. [REDACTED]

12 [REDACTED]

13 A. Okay. I have that one.

14 Q. Okay. [REDACTED]

15 [REDACTED]

16 A. Yes. I see that.

17 Q. And this isn't based on the document,
18 but based on your experience, under the scan
19 surface is an optical sensor so there has to be
20 some kind of equipment underneath the scan
21 surface to capture the image, right?

22 A. There does.

23 Q. And what kind of equipment would that
24 be generally?

1 medical imaging.

2 Q. We've been talking about the Kronos and
3 TimeLink technology. Just to make sure that
4 we're on the same page, you agree that those
5 both use Morpho hardware inside and functionally
6 for our purposes they're the same, right?

7 A. That's my understanding.

8 Q. Okay. I want to ask you just a few
9 questions about the Synel clock.

10 Does the Synel clock require the user
11 to put their finger on a fixed precise place?

12 A. I don't know. I'd need to look back at
13 the manual. I don't have that information in my
14 head.

15 Q. Do you remember, does it capture a roll
16 or a swipe?

17 A. I don't believe it's a roll and I don't
18 believe it's a swipe. I think it's the same
19 user experience as the other three time clocks.
20 That's just off the top of my head.

21 Q. Do you know how large the scan surface
22 of the Synel device was?

23 A. I do not. Oh, I'm sorry. I take that
24 back. So on my page -- on my paragraph 22 we

1 Q. This paragraph appears to address the
2 distribution of fingerprint data from time
3 clocks to other network locations.

4 Do you agree with that?

5 A. Yes.

6 Q. Does paragraph 18 state the entire
7 basis for your opinion in your opening report
8 regarding the TimeLink devices distributing
9 fingerprint data?

10 A. The documents I reviewed and quote here
11 certainly indicate how -- it indicates that
12 these devices are capable of distributing the
13 information. I also understand from doing
14 engineering for 30 years that there would be a
15 need for that to take place in order for the
16 system to work properly, and I also saw in
17 Kostas Mallias's declaration that he testified
18 about this.

19 Q. Let's go one sentence at a time. So it
20 says:

21 [REDACTED]

22 [REDACTED]

23 [REDACTED]

24 [REDACTED]

1 Is your opinion here that it can, that
2 the software can do that?

3 A. [REDACTED]

4 [REDACTED]
5 Q. Okay. Is that the limit of your
6 opinion, [REDACTED]

7 A. I see that there is also the
8 declaration of Kostas Mallias saying that I
9 guess Kronos received the database containing
10 fingerscan templates. [REDACTED]

11 [REDACTED]
12 [REDACTED]
13 [REDACTED]
14 [REDACTED]

15 Q. [REDACTED]

16 [REDACTED]
17 [REDACTED]
18 [REDACTED]
19 [REDACTED]
20 [REDACTED]
21 A. Yes. My -- just to fill out the point
22 about my engineering experience, it's clear that
23 these clocks could go wrong, and so it would be
24 important to be able to import and export data

1 so that after a failure, which is going to
2 happen, the clock could be -- that a new clock
3 could be brought up to speed without involving
4 everyone, so I understand why they would design
5 this capability into the devices.

6 Q. An opinion that that actually happened
7 would be based on Mr. Mallias's declaration,
8 right?

9 A. That was a piece of testimony that I
10 saw. It's definitely possible that there were
11 other -- I mean, companies need to back up their
12 systems. What we're talking about here is
13 simply backup.

14 Now, I did not review a document which
15 said the backup has happened, but I did see this
16 testimony from Mr. Mallias.

17 Q. Are you offering an opinion on the
18 accuracy of Mr. Mallias's testimony?

19 A. No.

20 Q. Do you know if the TimeLink -- do you
21 understand that TimeLink was bought by Kronos?

22 A. That is my understanding.

23 Q. Do you know if the TimeLink/Kronos
24 solution used by Speedway was a solution in

1 Q. Do you know what the reason for the
2 long period of time between the opening and
3 rebuttal was?

4 A. I do not.

5 Q. Do you know if Christopher Howe has
6 seen this rebuttal report?

7 A. No.

8 Q. All of your opinions in this case are
9 disclosed in either the opening report or the
10 rebuttal report, right?

11 A. I would give back just a little comment
12 in the sense that if I were presented with new
13 information, that could modify my opinions. But
14 as I sit here today, these are the opinions that
15 I'm offering.

16 Q. Is it your opinion that a fingerscan as
17 conducted by the Morpho devices is just a method
18 of collecting fingerprints?

19 A. That is my opinion.

20 Q. What is that opinion based on? We've
21 already talked about your experience. You don't
22 have to go into that. I know it's based on
23 that.

24 What else is it based on?

1 of the finger that is on the sensor is going to
2 be recorded.

3 Q. Mr. Minta goes on to write:

4 [REDACTED]
5 [REDACTED]
6 [REDACTED]

7 Do you disagree with that statement?

8 A. I do.

9 Q. Why?

10 A. My understanding that was provided to
11 me about the BIPA is that BIPA used finger
12 scanning as a way to obtain a fingerprint. That
13 also squares with my experience working in the
14 area and also just reading textbooks.

15 I mean, they all have the same view of
16 what a fingerprint means and that's not what
17 Mr. Minta is opining here.

18 Q. We mentioned textbooks. Earlier I read
19 to you from Introduction to Biometrics by Jain,
20 Ross, Nandakumar and forward by Wayman, and it
21 said:

22 "Fingerprints obtained by simply
23 placing the finger on the sensor surface
24 cannot capture the whole fingerprint."

1 A. What has to happen for the device to
2 work minimally is that the image fingerprint has
3 to be acquired and that has to go to a memory so
4 that the microprocessor can create the template.

5 After that the device may or may not
6 throw away the fingerprint image data, but the
7 data has to exist for long enough for the
8 microprocessor to do that feature extraction
9 into the template.

10 Q. And that would be for a fraction of a
11 second, correct?

12 A. If that's how fast the microprocessor
13 is and how complicated the template algorithm
14 is.

15 Q. Okay. Typically in a consumer user
16 experience, you would want it to be less than a
17 second, correct?

18 A. In the device I worked on, you do not
19 want to be annoying the user by having a long
20 period for authentication.

21 Q. Can you think of any reason why
22 fingerscan time clocks would be different?

23 A. So time clocks are also used by humans
24 who will get frustrated if they have to wait a

1 [REDACTED]

2 [REDACTED]

3 A. There are various ways of doing the
4 feature extraction to make the template from the
5 fingerprint, and those features that constitute
6 the template are what the machine looks for, and
7 I guess Mr. Minta is using the word pattern to
8 describe the template. So the matching is done
9 on the template which will list the features
10 formed from the fingerprint.

11 Q. Is that the same thing as an impression
12 of the ridges of the fingertip unique to each
13 human being and used as a means of
14 identification, which is the Chambers Dictionary
15 definition?

16 A. That's the definition of fingerprint.

17 [REDACTED]

18 [REDACTED]

19 [REDACTED]

20 The template is not the fingerprint.

21 It's a calculation based on the fingerprint.

22 Q. The template is a list of the features
23 found in the fingerprint, right?

24 A. I think that's fair.

1 Q. Do you know what that list looks like?

2 A. Well, that varies between

3 manufacturers, and so, you know, minutiae points
4 would be an example that is frequently used.

5 Also things like the direction of all the
6 ridges, that's a commonly used thing, where
7 whorls end. There are a variety of ways to do
8 the calculation of the template.

9 Q. [REDACTED]

10 [REDACTED]

11 A. Okay. I have that one up, 31.

12 Q. Okay. Here you write:

13 [REDACTED]

14 [REDACTED]

15 [REDACTED]

16 [REDACTED]

17 [REDACTED]

18 [REDACTED]

19 A. Yeah. I guess the company is now
20 IDEMIA, but it was Sagem, yeah.

21 Q. And then you say, [REDACTED]

22 [REDACTED]

23 I'm wondering why you said [REDACTED] What
24 would possibly be wrong with that? I mean,

1 MR. FICZKE: Objection. One second,
2 Dr. Daft. Objection; compound question.

3 BY MR. WOLFE:

4 Q. I'll ask it again.

5 MR. FICZKE: Yeah, if you can fix it.

6 BY MR. WOLFE:

7 Q. You believe what's initially collected
8 is a fingerprint, correct?

9 A. Yes.

10 Q. And is it your understanding of
11 Mr. Minta's opinion that he does not think a
12 fingerprint is initially collected?

13 A. That is my understanding, yes.

14 Q. And when we get to pages 25 to 27, he's
15 got a detailed description of how the devices
16 work. And my question is, other than his
17 opinion that what's initially collected is not a
18 fingerprint, do you disagree with anything else
19 in his description of how the devices work?

20 A. I disagree with -- well, I think that
21 his description here supports my conclusion that
22 the devices are collecting and storing biometric
23 information, but that biometric information is
24 the template.

1 is inaccurate?

2 A. I don't see a problem with Figure 12.
3 I don't know its prominence, but it squares with
4 my understanding of how these devices work.

5 Q. Okay. Look at Figure 13. Based on
6 your experience and education, do you have
7 reason to believe that Figure 13 is inaccurate?

8 A. I'm trying to see what the difference
9 between 12 and 13 is. Currently I'm thinking
10 that it's just the red X on the template
11 encryption or rather the matcher algorithm. I
12 mean, from the -- for the purposes of what's at
13 issue here, again you see a sensor collecting
14 data which to me is obviously a fingerprint.

15 That has to get stored in memory so
16 that the CPU can turn it into a template, and I
17 see at the top right again template storage. So
18 if this is an accurate representation of what
19 goes on inside the device, then it's supporting
20 my opinions.

21 MR. WOLFE: New exhibit.

22 (Exhibit 13 was marked for
23 identification.)

24 MR. WOLFE: So 13 is document

1 Q. What is that reason?

2 A. An image -- in order for the device to
3 work, the image must be stored because data must
4 be provided to the microprocessor to calculate
5 the template, so the image must be stored.

6 Q. And when you say stored, you're
7 referring to the transient image that would
8 exist for less than a second while feature
9 extraction takes place, right?

10 A. What I'm saying is that regardless of
11 how long it's stored for, it has to be stored or
12 the device wouldn't work.

13 Q. But like we talked about earlier, it
14 would be very typical for an image to be
15 captured, the features extracted, and the image
16 discarded, right?

17 A. Yes. I think that typically is a way
18 these devices work.

19 Q. And that process takes less than a
20 second?

21 A. I think that's fair, but I disagree
22 with the statement no images are stored at all
23 within the Kronos system because if that's true,
24 the device can't work.

1 Q. It has to store the image briefly in
2 order to extract the features is your opinion?

3 A. Yes. I mean, that's how it has to
4 work. The microprocessor has to have data to
5 work with because the template is a calculation
6 from the fingerprint image.

7 Q. Okay.

8 A. [REDACTED]

9 [REDACTED]

10 [REDACTED]

11 [REDACTED]

12 [REDACTED]

13 [REDACTED]

14 [REDACTED]

15 [REDACTED]

16 [REDACTED]

17 [REDACTED]

18 Q. I understand. And that process would
19 take less than a second?

20 A. Typically it could.

21 Q. Now, the IAFIS system actually does
22 store fingerprint images, right?

23 A. That's how it started, yes. And so
24 that is a -- I agree with Kronos that there are

1 differences between IAFIS and the Touch ID, [REDACTED]
2 [REDACTED]
3 [REDACTED]

4 Q. Look at the diagram at the bottom of
5 the page.

6 MR. FICZKE: Is that the Step 1
7 diagram?

8 MR. WOLFE: Yes, sir.

9 BY MR. WOLFE:

10 Q. Is that diagram accurate from, you
11 know, a basic perspective of how the technology
12 works?

13 A. It is beyond me how the technology
14 could work if the fingerprint was not stored so
15 that the template could be produced from it.

16 Q. Okay. And then let's go, let's break
17 it down a little bit. [REDACTED]
18 [REDACTED]

19 Do you think that part is accurate?

20 A. Yes.

21 Q. [REDACTED] So your opinion is that
22 the fraction of a second capture is equivalent
23 to storage; is that right?

24 A. The word storage doesn't have inside it

1 some minimum time. Storage means that the data
2 comes into the device and it has to be put in a
3 holding place for the scan to finish, and then
4 the microprocessor refers to that information in
5 order to get to the template. So that's
6 storage, no matter how fast the microprocessor
7 works.

8 Q. And then the next part of the sentence
9 says, [REDACTED]

10 Now, I know you didn't write this
11 document, but I want to get your understanding
12 of what do you think they mean, based on your
13 expertise, about what is biometric data being
14 converted here from the fingerscan?

15 MR. FICZKE: Objection to the extent it
16 calls for speculation and the fact that
17 Dr. Daft already indicated he has never
18 seen this document before.

19 But, Dr. Daft, if you know the answer,
20 feel free to answer.

21 BY THE WITNESS:

22 A. [REDACTED]
23 [REDACTED]
24 [REDACTED]

1 [REDACTED] [REDACTED]
2 [REDACTED]
3 [REDACTED]
4 [REDACTED]
5 [REDACTED]
6 [REDACTED]
7 [REDACTED]

8 BY MR. WOLFE:

9 Q. And the template is a list of features
10 formed from the fingerscan based on whatever
11 algorithm is in play in these devices?

12 A. Yes. The template is a computation of
13 let's call it the essence of what the
14 fingerprint has.

15 Q. And I don't want to ask you right now
16 about your opinions about recreating the
17 fingerprint. We'll get to that.

18 [REDACTED]
19 [REDACTED]
20 [REDACTED]
21 [REDACTED] about
22 that?

23 A. I don't know how the device works. [REDACTED]
24 [REDACTED]

1 [REDACTED]
2 [REDACTED]

3 That's my speculation as to what that
4 -- the first part of the Step 2 sentence means.

5 Q. Okay. Do you disagree that a template
6 is a mathematical representation?

7 A. No. I think that's a fine description
8 of template.

9 Q. Are you aware if templates -- templates
10 are stored in the system somehow, right?

11 A. Yes, because otherwise they couldn't
12 work and, you know, Mr. Minta's report has
13 diagrams including template storage.

14 Q. Do you know, are they stored in a
15 table, something like a CSV file?

16 A. So I don't know. But from my
17 experience with embedded systems -- this is an
18 embedded computer system -- I would doubt that
19 the template storage is a CSV file, but honestly
20 I don't know.

21 Q. You don't know what kind of file it
22 would be stored in?

23 A. I would expect that on an embedded
24 system it would not be stored in a rather

1 publicly-available document.

2 MR. FICZKE: Okay.

3 BY MR. WOLFE:

4 Q. I want to ask you a few questions
5 about, just a few about this. [REDACTED]

6 [REDACTED]
7 [REDACTED]
8 [REDACTED]

9 Do you think there is anything
10 inaccurate about that?

11 A. That particular sentence seems fine. I
12 mean, it sounds like they are -- [REDACTED]

13 [REDACTED]
14 [REDACTED]

15 Q. And at the top of the next column, the
16 first sentence says:

17 [REDACTED]
18 [REDACTED]
19 [REDACTED]

20 Do you agree with that?

21 A. I do not.

22 Q. And is that for all the reasons we've
23 talked about today?

24 A. It is. I mean, they are stating that

1 Kronos is different from AFIS that law
2 enforcement uses, and that's certainly true.

3 [REDACTED]
4 [REDACTED]
5 [REDACTED]
6 [REDACTED] [REDACTED]
7 [REDACTED]
8 [REDACTED]
9 [REDACTED]

10 Q. And when you say stored, again you mean
11 for a short period of time while feature
12 extraction takes place?

13 A. Yes, and I don't see in the word stored
14 some threshold of a time period.

15 Q. Okay. So if you look at the diagram at
16 the bottom of the page, in Step 1 do you
17 disagree with their characterization for the
18 same reason you just said?

19 A. Let me run through that sentence.

20 [REDACTED]
21 [REDACTED] [REDACTED]
22 [REDACTED] [REDACTED]
23 [REDACTED]
24 [REDACTED]

1 Q. [REDACTED]

2 [REDACTED]
3 A. Okay. I have that.

4 Q. In the middle of this paragraph you
5 said:
6 [REDACTED]
7 [REDACTED]
8 [REDACTED]
9 [REDACTED]
10 [REDACTED]

11 Now, we just looked at Mr. Minta's
12 reports and some other documents, time clock
13 manuals. In your opinion none of that is
14 evidence of a difference in those two terms?

15 A. I'm just baffled by the opinion that
16 these time clocks don't acquire fingerprints,
17 and I understand that the statute is saying that
18 fingerscan is one way of collecting the
19 fingerprint.

20 So my opinion is incredibly simple and
21 it is just that -- and it's obvious to me --
22 that through finger scanning, fingerprints are
23 being acquired.

24 Q. Is it your opinion that a portion of a

1 fingerprint is the same thing as a fingerprint?

2 A. I think it's obviously different.

3 Q. Well, Mr. Minta and the owner manuals
4 indicated that the sensing area of the devices
5 may be smaller than a full fingerprint.

6 Is that not evidence of a difference
7 between a fingerscan and a fingerprint?

8 A. No, it is not, because the fingerprint
9 is simply a pattern of ridges. It's not -- a
10 fingerprint isn't a term of art. It's what
11 people outside of the -- of this technology area
12 think it means.

13 So maybe it's a -- so I understand that
14 Kronos is using the difference between an AFIS
15 acquisition and their devices. They're pointing
16 to a difference there which I agree with. But
17 when you do finger scanning, the data you get is
18 a fingerprint.

19 Q. Okay. So my question is, is the
20 material information that I just showed you, is
21 that not evidence or is it that you think that
22 the evidence is, you know, not worthy and should
23 be discredited?

24 A. These documents, the two documents you

1 Do you see that?

2 A. I do.

3 Q. My question is, after the long
4 discussions we've had today and the documents
5 that we've looked at throughout the day, is it
6 still your opinion that there is no evidence to
7 support a difference?

8 A. My opinion remains that finger
9 scanning, as I state in my report, is the verb
10 and fingerprint is the noun that you get from
11 doing the verb.

12 Q. Okay. You didn't quite answer my
13 question though. The question is, is there no
14 evidence to support a difference or are you
15 resolving the evidence to your opinion?

16 A. I see -- so let me answer it this way.

17 When -- every time that Mr. Minta is
18 using fingerscan as a noun, I'm baffled because
19 it's obviously a fingerprint.

20 Q. Is the fact that the sensors may scan
21 something less than a full fingerprint not
22 evidence that there could be a difference
23 between a fingerscan and a fingerprint?

24 A. So let me answer that in two parts.

1 BIPA says that finger scanning is the verb to
2 get the fingerprint, and a small sensor will
3 produce a truncated fingerprint. It's still a
4 fingerprint. It might not cover the entire
5 finger, but it's still a fingerprint.

6 Q. Okay. Five minutes ago you told me
7 there was obviously a difference between a
8 partial fingerprint and a full fingerprint.

9 A. That's correct. It's fuller
10 data, yes.

11 Q. Go to paragraph 42 and 43 in your
12 report.

13 A. Okay. I see that.

14 Q. Your opinion here is that Ms. Jones's
15 deposition does not support the statement in the
16 Minta opening report; is that right?

17 A. I did not find that -- the information
18 that's in Mr. Minta's report, I didn't find that
19 in the deposition transcript.

20 Q. Okay. Do you have any other basis for
21 the opinion in this part of the report?

22 A. The only opinion I'm giving here is
23 that there isn't support for the claim on page
24 31 lines 23 to 24. There was a citation there

1 and I followed up on the citation and I couldn't
2 find what was being referred to, and there isn't
3 a citation to a line of the deposition
4 transcript.

5 Q. Thank you for your clear answer.

6 Paragraphs 44 and 45 with the subheading,
7 [REDACTED]

8 [REDACTED]

9 A. I see that, yes.

10 Q. Your opinion here is that the statement
11 in Mr. Minta's opening report is inconsistent
12 with Kostas Mallias's declaration; is that
13 right?

14 A. It is inconsistent, that's correct.

15 Q. And the basis for that opinion is your
16 review of Minta's opening report and Mallias's
17 declaration?

18 A. That's -- so I guess that there is a
19 couple of parts to this. Other citations show
20 that the database sharing is possible. This was
21 one piece of evidence that it had actually
22 happened, and my engineering background suggests
23 that the networking capabilities of these time
24 clocks would be used for backups.

1 So I suspect that's not the only time
2 that the templates moved from a clock to the
3 central server or back in the other direction,
4 but these citations I have here are one example
5 that I saw in the evidence.

6 Q. Thank you for that. And we talked
7 about that earlier, right? [REDACTED]

8 [REDACTED]

9 [REDACTED]

10 A. That's right.

11 Q. Okay. Is there any other basis for
12 this opinion other than what's in your opening
13 report and what we talked about earlier and the
14 statement in your rebuttal?

15 A. The other thing I would say is in order
16 to run a corporation with a lot of convenience
17 stores, backup is necessary. And so I would be
18 very surprised if these time clocks were not --
19 you know, if the company did not use the
20 networking capabilities built into the time
21 clocks for backup purposes.

22 Q. What experience in biometrics do you
23 have that Mr. Minta does not?

24 A. I don't know that I can answer for

1 Q. Your opinion is that it is not
2 impossible to reverse engineer a fingerprint
3 from a template; is that right?

4 A. My opinion is that it is not impossible
5 to reverse a template into a fingerprint.

6 Q. Do you have some ideas about how it
7 could be done?

8 A. Yes, and those are cited in my report.

9 Q. One of them involved invertible neural
10 networks, right?

11 A. That's correct.

12 Q. Are you an expert in invertible neural
13 networks?

14 A. I have been working in neural networks,
15 I hate to say, since 1990, so this is a variety
16 of neural network that I'm familiar with.

17 Q. What does it mean to be an invertible
18 neural network?

19 A. It means that there is a forward
20 process. In this case the forward process is
21 the mathematical calculation from the
22 fingerprint to the template, and what the neural
23 network is doing is learning, as in machine
24 learning, how to do the reverse process, going

1 from the template to the fingerprint image.

2 Q. Can you describe your experience with
3 invertible neural networks?

4 A. So invertible neural networks are
5 actually the subject of one of the publications
6 in my CV. I can find which one it is if that's
7 helpful.

8 Q. Yes. I would like to know.

9 A. It is citation 19 on page 5 of my CV.

10 Q. Can you describe generally what that
11 paper was about?

12 A. Yes. So the goal there was we have a
13 situation, it was a medical imaging situation,
14 and the -- we know what I'll call the forward
15 problem.

16 So this is ultrasound tomography.

17 Imagine it in breast imaging. You've got the
18 breast in a water tank and there is ultrasound
19 transducers surrounding the breast. We know how
20 to solve that problem in the forward direction.

21 What I mean by that is given the
22 tissue, we can predict what the data acquired by
23 the sensors did, and we can do that reliably.

24 What is of great interest for medicine

1 is being able to do the inverse problem, which
2 is going from the sensor data back to the tissue
3 characteristics of the breast and being able to
4 make an image of the breast.

5 So what we were doing in that work is
6 parallel to the situation with the fingerprint
7 image and the template. So in this situation
8 I'm going from the acquired data back to an
9 image of the breast, given that I know how to do
10 the forward problem. So the neural network
11 learns the inverse problem, which I can't do.

12 So in the same way, with the
13 fingerprint obviously we know what the forward
14 problem is because that's just the software
15 being executed by the microprocessor, and the
16 inversion in the invertible neural network is
17 teaching by machine learning that network to go
18 in the opposite direction. That's how this work
19 is similar to inverting the template back into
20 the fingerprint.

21 Q. Are you aware of anyone who has reverse
22 engineered a fingerprint image from a template
23 using invertible neural networks?

24 A. I'm not aware of that. I have another

1 citation not using invertible neural networks
2 where the fingerprint image is being produced
3 from the template.

4 Q. When you refer to that citation, are
5 you referring to the article Fingerprint Image
6 Reconstruction from Standard Templates by
7 Cappelli and others?

8 A. Yes. So that's peer reviewed actually
9 in a very prestigious journal, the IEEE
10 Transactions on Patent Analysis and Machine
11 Intelligence.

12 Q. Okay. We'll get to that. You also
13 mentioned the use of artificial intelligence in
14 your rebuttal?

15 A. Yes. And to be clear, artificial
16 intelligence these days is sometimes used
17 synonymously with neural -- actually often used
18 synonymously with neural networks.

19 Q. Is that also true of the term deep
20 learning?

21 A. Yes. All of those terms are kind of
22 mashed together. Now, it's -- basically what
23 all of that means is I know how to do the
24 forward problem. I know how to go from the

1 fingerprint to the template.

2 I am going to show the system -- which
3 we can call a deep learning device, a neural
4 network, or an artificial intelligence. I'm
5 going to show it what are examples of
6 fingerprints and templates, and from that
7 training experience, this AI is going to learn
8 how to invert.

9 Q. Got it. So you mentioned invertible
10 neural networks, artificial intelligence, and
11 deep learning, which I understand you to be
12 saying are all approximately the same as being
13 what you just described; that's how you would do
14 it in a general --

15 A. That's right. They are all learning
16 systems and those terms are -- I mean, 20 years
17 ago those terms meant different things, but
18 these days I think it's lost some precision.
19 But all I'm meaning is it's a learning system
20 that you train.

21 Q. Got it. Now, you mentioned in passing
22 just now the paper by Cappelli and others.
23 We'll talk about that in a minute.

24 Do you have any other ideas about how a

1 fingerprint could be reverse engineered from a
2 template?

3 A. No. I think between machine learning
4 algorithms and what Cappelli shows, that's
5 what's backing up my claim that it is not
6 impossible to do.

7 And I should add one other thing, that
8 the capabilities of these AI systems are
9 advancing with extraordinary speed. So it is
10 very possible that if it's too hard today, that
11 it won't be too hard in six months.

12 Q. Sure. Okay. So have you ever seen the
13 Cappelli article before you found it in
14 connection with this project?

15 A. No.

16 Q. Have you read any other papers, studies
17 or publications on the topic of fingerprint
18 image reconstruction from templates?

19 A. In one of the standard textbooks that I
20 cite, I think it's Jain's book, there is a whole
21 section that is entitled Attacks on the Template
22 Database. So, in other words, this is some
23 actor that wants to break into the biometric
24 system, and so in that section in that monograph

1 there is some other information on converting
2 templates to fingerprint images.

3 Q. And in that chapter in the Jain
4 textbook, J-a-i-n, other topics besides
5 reconstruction of templates are addressed,
6 right?

7 A. That's correct.

8 Q. And it mentions a whole bunch of
9 methods of attacking the database and utilizing
10 the information in the database, right?

11 A. Yes.

12 Q. How long is the portion of the Jain
13 chapter on template reconstruction?

14 A. I see that the -- I'm just reading from
15 my report. I see that attacks on the template
16 database is 18 pages long.

17 Q. Okay. And then the portion of that
18 template reconstruction is something less than
19 18 pages?

20 A. Yes, I think so.

21 Q. Okay. So tell me about the Cappelli
22 article and how they purportedly reconstructed
23 fingerprint images from templates.

24 A. Well, they did examples of

1 reconstructing fingerprint images from template
2 data.

3 Q. Do you have any firsthand experience
4 with that?

5 A. I have not attempted to reconstruct
6 fingerprint images from template data. However,
7 because I have been a neural net person for a
8 long time, I know exactly how to do it.

9 Q. Okay. How would you do it?

10 A. I would get a large database and I
11 would set up a neural network or actually a
12 variety of neural networks and I would train
13 them on that data, and then I would validate the
14 result by showing it template information that
15 it had not seen in the training setting.

16 Q. And if you wanted to train a neural
17 network to reconstruct fingerprint images, you
18 would need to know about the algorithm that is
19 operating on the finger to create the original
20 template, right?

21 A. Actually no. All I would need is
22 examples of fingerprints and their corresponding
23 templates. I would not need to know what the
24 algorithm was.

1 Q. You could back out the algorithm?

2 A. It's possible. I wouldn't put it quite
3 like that. The neural network eventually after
4 training understands what the algorithm is. But
5 I would not -- in order to break into this
6 system, I would not need, for example, the
7 source code running on a Kronos microprocessor.
8 I would only need the fingerprint data and the
9 template data.

10 Q. Okay. And within this database all the
11 templates would have to be constructed the same
12 way, right?

13 A. Yes. So the machine learning system is
14 learning one specific algorithm. It would have
15 to be repeated if there were a different
16 algorithm in play.

17 Q. So the templates you would have would
18 be -- I'm not going to use the right terms.
19 They would be in some sort -- I mean this in a
20 colloquial sense.

21 The templates that you would have would
22 be in some code, right? Like the first part of
23 the template corresponds to X, the next part of
24 the template corresponds to Y, and eventually if

1 you have enough of them, you can -- and the
2 original fingerprint images, you can figure out
3 how to reconstruct by teaching the machine that
4 this template came from this image and this is
5 what the code is?

6 A. That's right. I mean, that's true and
7 it's actually true even independent of how the
8 template information is encoded. So you were
9 asking earlier about how that data is stored.
10 This approach doesn't care about how that data
11 is stored.

12 Q. What do you mean by that, doesn't care
13 about how the data is stored?

14 A. What I mean is that if the template is
15 stored in a CSV file as you had asked me about
16 before, then this approach works. If the
17 template is stored as raw binary data, this
18 approach would also work.

19 Q. Are there other ways the template might
20 be stored?

21 A. Yes. There are -- I mean, the encoding
22 of that template data could be done in many,
23 many different ways.

24 Q. Could it be stored in a text file?

1 Q. Binary format is like zeroes and ones,
2 correct?

3 A. That's right, and obviously also there
4 are many ways to do the encoding. By saying
5 it's binary format, really what's meant there is
6 it's not human readable.

7 Q. Okay. Would a human ever have occasion
8 to read a fingerprint template?

9 A. If they were attempting to attack a
10 biometric system, yes.

11 Q. If you were a human, not a machine, who
12 wanted to read a fingerprint template, what
13 would you do?

14 A. There is software that allows the
15 binary data to be represented in a human
16 readable format. That's not what we were just
17 looking at in Mr. Minta's expert report. What
18 he's showing is binary data that's just read
19 into a text editor.

20 So in the world of, you know,
21 undermining biometric systems, you would be
22 using a binary data editor.

23 Q. Okay. So a binary data editor is the
24 software that you just described?

1 doesn't apply here.

2 Q. Okay. Templates are the result of
3 feature extraction, correct?

4 A. I think that's fair.

5 Q. And a template contains some lesser
6 amount of data than the original image, correct?

7 A. Yes. We can see in Table 1 of the
8 paper which I guess is on page 1492, this is
9 showing the type of information that's in the
10 template.

11 Q. So as part of the reconstruction
12 process, the image that is reconstructed is
13 going to be missing some information that would
14 have been in the original image; is that right?

15 A. Well, that's where if you remember many
16 hours ago we were talking about compressed
17 sensing, how a digital camera can produce a
18 resolution that's much higher than its sensor's
19 resolution.

20 While the template is much smaller than
21 the image, if it's got the key information and
22 if the algorithm or the learning system is
23 clever enough, then that is resulting in a
24 synthetic fingerprint of good quality.

1 Q. Did Cappelli and his coauthors use that
2 method?

3 A. Cappelli and the coauthors use the
4 template data and they invent an algorithm that
5 analyzes the template data and creates a
6 synthetic fingerprint image, and then they
7 evaluate how good that image is.

8 Q. And ultimately they conclude that it
9 would be unlikely to fool a human reviewer but
10 potentially could fool the same system; is that
11 right?

12 A. That is what is stated in the abstract,
13 and I have no reason to doubt that in 2007 that
14 is what they concluded. So a high chance of
15 deceiving state-of-the-art commercial
16 fingerprint recognition systems, I think that's
17 important for this case, because we're not
18 talking about a human expert in fingerprints
19 looking at the data. We're talking about can
20 the machines be deceived.

21 Q. Is the reconstructed image transferable
22 from one system to another? So if I reconstruct
23 an image from the TimeLink system, can I go use
24 it on the Qualcomm phone?

1 A. I think so because it's just the
2 scanned image, and so that is far more doable
3 than, you know -- if you don't know what the
4 fingerprint template is, once you've got it back
5 to an image, I think you can use it in other
6 systems far more easily.

7 Q. But the reconstructed image is based on
8 reversing the algorithm essentially, right?

9 A. I wouldn't put it that way. What
10 they've done here is they have made an algorithm
11 that understands the template and predicts the
12 image, so it's through their understanding of
13 the characteristics of fingerprints.

14 So the reason I brought up the
15 compressed sensing in the digital camera is it's
16 the same thing. The small amount of data plus
17 the knowledge of the algorithm is able to get
18 back with some level of fidelity to the
19 fingerprint image.

20 Q. Would it make a difference if the
21 feature extraction method was different from one
22 sensor to the another, like if one was doing
23 minutiae and one was doing, you know, ridge
24 flow?

1 would have to do that work again for a different
2 feature extraction algorithm.

3 If I'm a bad guy and I want to make
4 money by breaking into the system, I would
5 choose the neural network approach where neither
6 the feature extraction specifics nor the
7 encoding of the data matter for creating the
8 fingerprint image, the synthetic fingerprint
9 image.

10 Q. And why did either of them matter?

11 A. The Cappelli paper presumes a certain
12 format and a certain kind of feature extraction.
13 So they're not trying to break into that system
14 to make money.

15 They're interested in what is the
16 algorithmic likelihood, so they've just
17 subtracted the whole question of how is the
18 template formatted and what's in the template.
19 They've subtracted that. They know all of that,
20 so that's not part of their work.

21 But if I'm a criminal, I would opt for
22 the approach where it doesn't matter about the
23 format and it doesn't matter about the feature
24 extraction.

1 Q. It would require a lot of resources,
2 right?

3 A. I disagree. The speed -- I mean, the
4 amount of learning power that is available with
5 commodity hardware, like let's say a desktop PC,
6 the amount of learning power in that has
7 improved at an extraordinary rate in the last
8 five to ten years.

9 Q. Do you think it could do an invertible
10 neural network of this power on a PC that I can
11 buy at Target?

12 A. I think, I mean my point in my report
13 is we can't make a statement that -- I disagree
14 with the statement that inverting the template
15 algorithm is impossible. I think that's
16 incorrect, and I think this paper shows that
17 algorithmically it's possible and I feel that a
18 neural network approach could be very suitable
19 for someone with nefarious intent.

20 Q. Okay. We've talked about the neural
21 network idea. We've talked about Cappelli and
22 his paper.

23 Do you have any other ideas about how a
24 fingerprint image could be reverse engineered

1 from a template?

2 A. I think there is some other information
3 in that section of the Jain book that I cite,
4 but my opinion is simply disagreeing with the
5 blanket statement that reversing the template
6 algorithm is impossible. That's my opinion. I
7 disagree that it's impossible.

8 Q. Okay. Can you go to Mr. Minta's
9 opening report, Figure 8.

10 A. Yeah, I have that.

11 Q. Okay. And Figure 8 is where you can
12 see the circuit board?

13 A. Okay. Yes, I have that.

14 Q. It's on page 21, right? There is three
15 photos of the interior of the time clocks?

16 A. Yes.

17 Q. [REDACTED]

18 [REDACTED]

19 [REDACTED]

20 [REDACTED]

21 [REDACTED]

22 A. That's right.

23 Q. How would you do that?

24 A. So the context of this is how much

1 effort is determined by how valuable the
2 information is, but the procedure would be to
3 use some means to attach to the points in the
4 circuit, for example, the pings.

5 [REDACTED]
6 [REDACTED] This is a standard free
7 scale microprocessor, very common device.

8 Q. Are you referring to Figure 8 here?

9 A. Yes.

10 Q. Okay.

11 A. So underneath that device there is a
12 whole bunch of pins, maybe 100, 150 of them. So
13 it is entirely feasible to interpose a connector
14 between that chip and the circuit board and
15 watch all of the signals coming out of that and
16 into that microprocessor.

17 Q. To do that, you have to physically
18 connect probes in the logic analyzer, right?

19 A. That's right.

20 Q. What do you do with the oscilloscope?

21 A. The oscilloscope would be useful
22 initially in learning what goes where in the
23 circuit. This could take some amount of time,
24 [REDACTED]

1 [REDACTED]
2 [REDACTED]

3 Q. You said using the oscilloscope to
4 learn what goes where in the circuit could take
5 some amount of time?

6 A. Yes.

7 Q. How much time do you think it would
8 take?

9 A. I can't tell you without having tried
10 to do this, this procedure.

11 Q. Do you personally have direct circuit
12 probing experience with a prefabricated board
13 like this?

14 A. I do.

15 Q. What is that experience?

16 A. When I worked at Cephasonics, we had
17 lots of circuit boards where we have to probe
18 with a logic analyzer in just the way that I've
19 been describing.

20 Q. And what kinds of projects were you
21 working on when you were doing that?

22 A. That was like an integrated circuit,
23 some that we designed, and so the goal of the
24 work was to understand whether the integrated

1 Once we have the circuit doing what we
2 want or mostly doing what we want, then I go off
3 and work on algorithms or something. So there
4 were times when I was doing a lot of this and
5 times when I was doing none of it.

6 Q. So over the two years that you were at
7 Cephasonics, less than ten percent of your time?

8 A. We were pretty good. We could make
9 circuits that work. And so the amount of
10 probing that needed to be done was probably less
11 than ten percent, but it's just a skill. I
12 mean, once you know how to do it, it's not like
13 if I spent my whole day doing it, I'm better.
14 It's more of just once you know how to do this
15 thing, it's an ordinary engineering skill.

16 Q. At Cephasonics were you trying to
17 reverse engineer other people's technologies so
18 you could copy it?

19 A. No, but trying to figure out a circuit
20 board that's not working the way you want is
21 just the same.

22 Q. At Cephasonics you would have the
23 schematic diagram to know how it should work,
24 right?

1 A. That's correct, and I know that I can
2 go to the free scale website and I can download
3 a document that tells me exactly what every pin
4 under that MX-1 chip does. So I already know
5 all of that information. I don't need to figure
6 that out.

7 Q. Okay. A schematic diagram would be
8 really helpful, right?

9 A. The schematic diagram can be obtained
10 by reverse engineering the circuit board, so if
11 this is something -- if this is a project where
12 resources are available, the schematic can
13 easily be reverse engineered.

14 Q. Okay. A minute ago you said, I know I
15 can go to the free scale website and I can
16 download a document that tells me exactly what
17 every pin is under the MX-1 chip.

18 A. MX-1, it's a microprocessor. So yes,
19 free scale documents, they're products, and so
20 that includes telling me exactly what every pin
21 does.

22 Q. Did you actually do that?

23 A. If I were on this project, that would
24 be one of the first things I would do.

1 Q. But you didn't actually do it on this
2 project, right?

3 A. I have not had a device in front of me.

4 Q. Okay. And you didn't go to the
5 DragonBall website and get the schematic
6 diagram?

7 A. No, because that would only be useful
8 if I were seriously reverse engineering the
9 circuit.

10 Q. Your point is simply that it is -- in
11 your opinion it is possible to reverse engineer
12 the circuit?

13 A. I think I put it slightly stronger than
14 that. Reverse engineering the circuit is
15 completely doable by an organization with enough
16 resources.

17 Q. Like the National Security Agency?

18 A. I don't know what they -- I don't know
19 what goes on inside there, but I know that in
20 many cases people reverse engineer circuits like
21 this simply because there is an economic
22 motivation to do so.

23 Q. All right. So do you agree with me
24 that the schematic diagram would be helpful?

1 A. Yes, and I'm saying that one can
2 reverse engineer the schematic diagram from the
3 physical object.

4 Q. Why would you need the schematic
5 diagram for reverse engineering from the object?
6 I don't understand.

7 A. Well, it's certainly helpful to have
8 the schematic. What I'm saying is there is
9 nothing magical that needs to take place to go
10 from that board and its components to the
11 schematic. It's a bunch of tedious work but
12 it's not hard.

13 Q. How many hours total would you estimate
14 you spent at Cephasonics on direct circuit
15 probing?

16 A. I don't recall, but I will reinforce
17 that this kind of probing, it's just a skill.
18 You learn it at some point and you can do it
19 afterwards. It's not a magical skill. It's a
20 standard engineering technique.

21 Q. Was it less than 100 hours?

22 A. I think so.

23 Q. All right. So looking at the photo on
24 the right in Figure 8, where on the circuit

1 board would you connect to the signals?

2 A. I think the correct answer to that is
3 as many places as possible. So that would
4 include places like if you look at the bottom
5 left, you'll see some solar panels. So that's
6 one place that's very easy to connect.

7 You would also connect to -- I mean,
8 you see three large integrated circuits. You
9 would connect to all of the pins of each of
10 those circuits, and you would connect to as many
11 other places as you can find.

12 Q. A circuit board can have multiple
13 layers, right?

14 A. That's correct.

15 Q. And some signals can be on inner layers
16 of the board?

17 A. Yes. And so when people are doing
18 reverse engineering, they slice these boards up.
19 That's how you figure out -- I mean, the board
20 is made from a bunch of layers that are glued
21 literally together and it is sectioned so that
22 it goes back to the parts that go into making
23 the circuit board.

24 So at that point you know what the

1 layout is everywhere, including in the internal
2 layers.

3 Q. I'm a little confused by your last
4 sentence. You said, At that point you know what
5 the layout is everywhere, including the internal
6 layers. At what point do you mean?

7 A. I'm sorry. Let me say that
8 differently.

9 The way a multilayer board is made is
10 from a number of layers. They're physically
11 separate pieces that are in the manufacture and
12 they're glued together. When you're doing
13 reverse engineering, you use a precise saw to
14 divide the board up so that you get back all of
15 those pieces which were the input to the board's
16 manufacture. Once you've sliced the board into
17 those pieces, then you can see the layout for
18 the entire board.

19 Also in doing reverse engineering there
20 are techniques like taking an x-ray of the
21 circuit board provides lots of helpful
22 information, so this field of reverse
23 engineering is incredibly sophisticated.

24 There were lots of standard techniques

1 that have been -- that are known for doing
2 reverse engineering. But certainly the fact
3 that this board is probably multilayer isn't an
4 obstacle to reverse engineering it.

5 Q. You say the layers are glued together,
6 right?

7 A. That's right.

8 Q. Are they covered in some kind of
9 protective coating before they're glued
10 together?

11 A. It's laminated in a certain way so that
12 -- I mean, you have to make it so the one
13 layer's copper, the conductors, doesn't
14 interfere with another layer's copper. But
15 they're laminated together with glue. I mean,
16 this is very standard technology.

17 Q. What kind of saw do you use to separate
18 the layers?

19 A. There are lots of sophisticated saws.
20 You know, one that works is a saw like the type
21 of saw that's used to cinculate, which means
22 divide up, integrated circuits.

23 There are other -- I mean, another way
24 of doing it, perhaps simpler, is simply to take

1 the circuit board and put it rotating like a
2 sander, right? So you can just abrade a layer
3 of the circuit board and then you'll see what's
4 underneath it. This is standard procedure.

5 Q. Do you know how many layers this board
6 has?

7 A. I do not.

8 Q. But you said it's likely a multilayered
9 board?

10 A. That would be my guess.

11 Q. When you have a multilayered board like
12 this, can you be sure that the visible or
13 accessible signals are the signals that you need
14 to access?

15 A. For purposes of reverse engineering,
16 you don't need to know everything. Those three
17 chips that we can see are the three black
18 squares. If you -- and if are reading every pin
19 of each of those chips, that's providing an
20 enormous amount of information suitable for
21 reverse engineering what's going on.

22 So you don't have to go after every
23 last -- every last piece of copper. Doing that
24 could well be sufficient.

1 Q. How much time do you estimate it would
2 take for someone with a reasonably high degree
3 of microelectronic skill to do what you just
4 talked about?

5 A. I can't give a reliable answer to that.
6 I have -- I mean, this is called a teardown.
7 That's the -- I mean, that would be how you'd
8 get all of the points. You can see teardowns.

9 Every time there is a new iPhone, the
10 reverse engineering companies do a teardown and
11 they find out everything about that product
12 including what's going on inside the chips,
13 which is much harder than what I've been
14 describing, which is learning what goes on on a
15 circuit board.

16 So I can't estimate the amount of
17 resources needed to do it. I do have a lot of
18 confidence that given enough resources, this is
19 doable.

20 Q. From your experience in biosensing, do
21 you have an opinion or knowledge about whether
22 human finger ridges are regular and predictable
23 by some equation that can be applied to them?

24 A. What you just said is true to some

1 extent and not true generally, so I'm not
2 offering an opinion on that.

3 Q. When a fingerscan image is converted to
4 a template for feature extraction, some
5 information is lost, right?

6 A. Certainly, because the file size is
7 smaller. But again going back to the compressed
8 sensing thing, you can't conclude from the file
9 being smaller that you can't invert the process.
10 You can't say that that's impossible, ■■■■■

11 ■■■■■
12 Q. So your position is that although some
13 information is lost, it can be recreated?

14 A. That's right, and the reason it's
15 possible to recreate it, that's what Cappelli
16 shows, and also I would take us back to the
17 digital camera with the compressed sensing.

18 That file that the camera produces is
19 tiny compared with the resolution, yet it's got
20 all of the high quality photographs that the
21 user wants. So simply making the data smaller
22 does not mean that it's impossible to get back
23 to the original data, in this case the
24 fingerprint image.
